

# Longest Path Transversals in Chordal Graphs

Michael Wigal

joint work with James Long and Kevin Milans

AMS Fall Central Sectional Meeting 2023

October 7, 2023

# Gallai's Question

- ▶ In a connected graph, longest paths pairwise intersect (Folklore)

# Gallai's Question

- ▶ In a connected graph, longest paths pairwise intersect (Folklore)
- ▶ Is there a single vertex contained in every longest path of a connected graph? (Gallai 1968)

# Gallai's Question

- ▶ In a connected graph, longest paths pairwise intersect (Folklore)
- ▶ Is there a single vertex contained in every longest path of a connected graph? (Gallai 1968)
- ▶ Counterexample given by Walther in 1969.

# Gallai's Question

- ▶ In a connected graph, longest paths pairwise intersect (Folklore)
- ▶ Is there a single vertex contained in every longest path of a connected graph? (Gallai 1968)
- ▶ Counterexample given by Walther in 1969.
- ▶ Smaller counterexamples later given by Walther and Voss (1974) and Zamfirescu (1976)

# Gallai's Question

- ▶ In a connected graph, longest paths pairwise intersect (Folklore)
- ▶ Is there a single vertex contained in every longest path of a connected graph? (Gallai 1968)
- ▶ Counterexample given by Walther in 1969.
- ▶ Smaller counterexamples later given by Walther and Voss (1974) and Zamfirescu (1976)
- ▶ One such is the Petersen fragment:

# Gallai's Question

- ▶ There has been a line of work for characterizing which graph families Gallai's question holds.

# Gallai's Question

- ▶ There has been a line of work for characterizing which graph families Gallai's question holds.
- ▶ Cactus Graphs (Klavžar and Petkovšek 1990)

# Gallai's Question

- ▶ There has been a line of work for characterizing which graph families Gallai's question holds.
- ▶ Cactus Graphs (Klavžar and Petkovšek 1990)

# Longest Path Transversals

- ▶ A set of vertices is a longest path transversal if every longest path must intersect it.

# Longest Path Transversals

- ▶ A set of vertices is a longest path transversal if every longest path must intersect it.
- ▶ For a graph  $G$ , we let  $lpt(G)$  denote the size of a minimum longest path transversal.

# Longest Path Transversals

- ▶ A set of vertices is a longest path transversal if every longest path must intersect it.
- ▶ For a graph  $G$ , we let  $lpt(G)$  denote the size of a minimum longest path transversal.
- ▶ Gallai's question rephrased: In a connected graph  $G$ , is  $lpt(G) = 1$ ?

# Longest Path Transversals

- ▶ A set of vertices is a longest path transversal if every longest path must intersect it.
- ▶ For a graph  $G$ , we let  $lpt(G)$  denote the size of a minimum longest path transversal.
- ▶ Gallai's question rephrased: In a connected graph  $G$ , is  $lpt(G) = 1$ ?
- ▶ For connected  $n$ -vertex graph  $G$ ,  $lpt(G) \leq 8n^{3/4}$ . (Long, Milans, and Munaro 2021)

# Longest Path Transversals

- ▶ A set of vertices is a longest path transversal if every longest path must intersect it.
- ▶ For a graph  $G$ , we let  $lpt(G)$  denote the size of a minimum longest path transversal.
- ▶ Gallai's question rephrased: In a connected graph  $G$ , is  $lpt(G) = 1$ ?
- ▶ For connected  $n$ -vertex graph  $G$ ,  $lpt(G) \leq 8n^{3/4}$ . (Long, Milans, and Munaro 2021)
- ▶ For a connected  $n$ -vertex graph  $G$ ,  $lpt(G) \leq 5n^{2/3}$ . (Kierstead and Ren 2023)

# Longest Path Transversals

- ▶ A set of vertices is a longest path transversal if every longest path must intersect it.
- ▶ For a graph  $G$ , we let  $lpt(G)$  denote the size of a minimum longest path transversal.
- ▶ Gallai's question rephrased: In a connected graph  $G$ , is  $lpt(G) = 1$ ?

- ▶ For a connected  $n$ -vertex graph  $G$ ,  $lpt(G) \leq 5n^{2/3}$ . (Kierstead and Ren 2023)
- ▶ Does there exist constant  $C$ , such that for all connected  $G$ ,  $lpt(G) \leq C$ ? (Walther 1969)

# Interval Graphs

- ▶ Let  $\mathcal{F}$  be a family of sets.

# Interval Graphs

- ▶ Let  $\mathcal{F}$  be a family of sets.
- ▶ The intersection graph on  $\mathcal{F}$  is the graph with vertex set  $\mathcal{F}$ , and there is an edge between two set if and only if they intersect.

# Interval Graphs

- ▶ Let  $\mathcal{F}$  be a family of sets.
- ▶ The intersection graph on  $\mathcal{F}$  is the graph with vertex set  $\mathcal{F}$ , and there is an edge between two set if and only if they intersect.
- ▶ If  $\mathcal{F}$  is a set of intervals on  $\mathbb{R}$ , its intersection graph is an interval graph.

# Interval Graphs

- ▶ Let  $\mathcal{F}$  be a family of sets.
- ▶ The intersection graph on  $\mathcal{F}$  is the graph with vertex set  $\mathcal{F}$ , and there is an edge between two set if and only if they intersect.
- ▶ If  $\mathcal{F}$  is a set of intervals on  $\mathbb{R}$ , its intersection graph is an interval graph.
- ▶ If  $G$  is a connected interval graph, then  $lpt(G) = 1$ . (Balister, Györi, Lehel, and Schelp 2004)

# Interval Graphs

- ▶ Let  $\mathcal{F}$  be a family of sets.
- ▶ The intersection graph on  $\mathcal{F}$  is the graph with vertex set  $\mathcal{F}$ , and there is an edge between two set if and only if they intersect.
- ▶ If  $\mathcal{F}$  is a set of intervals on  $\mathbb{R}$ , its intersection graph is an interval graph.
- ▶ If  $G$  is a connected interval graph, then  $lpt(G) = 1$ . (Balister, Györi, Lehel, and Schelp 2004)
- ▶ Balister, Györi, Lehel, and Schelp then asked if the larger family of chordal graphs have the Gallai property.

# Chordal Graphs

- ▶ A chord of a cycle  $C$  is an edge not in  $C$ , with both endpoints in  $V(C)$ .

# Chordal Graphs

- ▶ A chord of a cycle  $C$  is an edge not in  $C$ , with both endpoints in  $V(C)$ .
- ▶ A graph  $G$  is chordal if every cycle of length at least four has a chord.

# Chordal Graphs

- ▶ A chord of a cycle  $C$  is an edge not in  $C$ , with both endpoints in  $V(C)$ .
- ▶ A graph  $G$  is chordal if every cycle of length at least four has a chord.
- ▶ A graph  $G$  is chordal if and only if it is the intersection graph of subtrees of a tree  $T$  (Gavril 1974).

# Chordal Graphs

- ▶ A chord of a cycle  $C$  is an edge not in  $C$ , with both endpoints in  $V(C)$ .
- ▶ A graph  $G$  is chordal if every cycle of length at least four has a chord.
- ▶ A graph  $G$  is chordal if and only if it is the intersection graph of subtrees of a tree  $T$  (Gavril 1974).
- ▶ Chordal graphs are a direct generalization of interval graphs.

# Chordal Graphs

- ▶ A chord of a cycle  $C$  is an edge not in  $C$ , with both endpoints in  $V(C)$ .
- ▶ A graph  $G$  is chordal if every cycle of length at least four has a chord.
- ▶ A graph  $G$  is chordal if and only if it is the intersection graph of subtrees of a tree  $T$  (Gavril 1974).
- ▶ Chordal graphs are a direct generalization of interval graphs.
- ▶ If  $G$  is a connected  $n$ -vertex chordal graph, then  $lpt(G) = O(\log^2(n))$ . (Long, Milans, W. 2023+).

# Chordal Graphs

- ▶ A chord of a cycle  $C$  is an edge not in  $C$ , with both endpoints in  $V(C)$ .
- ▶ A graph  $G$  is chordal if every cycle of length at least four has a chord.
- ▶ A graph  $G$  is chordal if and only if it is the intersection graph of subtrees of a tree  $T$  (Gavril 1974).
- ▶ Chordal graphs are a direct generalization of interval graphs.
- ▶ If  $G$  is a connected  $n$ -vertex chordal graph, then  $lpt(G) = O(\log^2(n))$ . (Long, Milans, W. 2023+).
- ▶ We achieved this bound by exploiting the tree-like structure of chordal graphs.

## Prior Work

- ▶ Treewidth is a fundamental graph parameter, denoted  $tw(G)$ .

## Prior Work

- ▶ Treewidth is a fundamental graph parameter, denoted  $tw(G)$ .
- ▶ Given a graph  $G$ , let  $\omega(G)$  denote the size of the largest clique.

## Prior Work

- ▶ Treewidth is a fundamental graph parameter, denoted  $tw(G)$ .
- ▶ Given a graph  $G$ , let  $\omega(G)$  denote the size of the largest clique.
- ▶  $tw(G) = \min\{\omega(H) - 1 : G \subseteq H \text{ and } H \text{ is chordal}\}$ .

## Prior Work

- ▶ Treewidth is a fundamental graph parameter, denoted  $tw(G)$ .
- ▶ Given a graph  $G$ , let  $\omega(G)$  denote the size of the largest clique.
- ▶  $tw(G) = \min\{\omega(H) - 1 : G \subseteq H \text{ and } H \text{ is chordal}\}$ .
- ▶ A bramble is a set of connected subgraphs that pairwise intersect or are joined by an edge.

## Prior Work

- ▶ Treewidth is a fundamental graph parameter, denoted  $tw(G)$ .
- ▶ Given a graph  $G$ , let  $\omega(G)$  denote the size of the largest clique.
- ▶  $tw(G) = \min\{\omega(H) - 1 : G \subseteq H \text{ and } H \text{ is chordal}\}$ .
- ▶ A bramble is a set of connected subgraphs that pairwise intersect or are joined by an edge.
- ▶ Transversals of brambles form a “combinatorial dual” to the treewidth parameter.

## Prior Work

- ▶ Treewidth is a fundamental graph parameter, denoted  $tw(G)$ .
- ▶ Given a graph  $G$ , let  $\omega(G)$  denote the size of the largest clique.
- ▶  $tw(G) = \min\{\omega(H) - 1 : G \subseteq H \text{ and } H \text{ is chordal}\}$ .
- ▶ A bramble is a set of connected subgraphs that pairwise intersect or are joined by an edge.
- ▶ Transversals of brambles form a “combinatorial dual” to the treewidth parameter.
- ▶ Longest paths are a bramble in a connected graph.

## Prior Work

- ▶ Treewidth is a fundamental graph parameter, denoted  $tw(G)$ .
- ▶ Given a graph  $G$ , let  $\omega(G)$  denote the size of the largest clique.
- ▶  $tw(G) = \min\{\omega(H) - 1 : G \subseteq H \text{ and } H \text{ is chordal}\}$ .
- ▶ A bramble is a set of connected subgraphs that pairwise intersect or are joined by an edge.
- ▶ Transversals of brambles form a “combinatorial dual” to the treewidth parameter.
- ▶ Longest paths are a bramble in a connected graph.
- ▶ For a connected graph  $G$ ,  $lpt(G) \leq tw(G) + 1$  (Rautenbach and Sereni 2014)

## Prior Work

- ▶ In a chordal graph  $G$ ,  $tw(G) = \omega(G) - 1$ .

## Prior Work

- ▶ In a chordal graph  $G$ ,  $tw(G) = \omega(G) - 1$ .
- ▶ In a connected chordal graph  $G$ ,  $lpt(G) \leq \omega(G)$ . (Rautenbach and Sereni 2014)

## Prior Work

- ▶ In a chordal graph  $G$ ,  $tw(G) = \omega(G) - 1$ .
- ▶ In a connected chordal graph  $G$ ,  $lpt(G) \leq \omega(G)$ . (Rautenbach and Sereni 2014)
- ▶ In a connected chordal graph  $G$ ,  $lpt(G) \leq 4\lceil \omega(G)/5 \rceil$ . (Harvey and Payne 2023)

## Prior Work

- ▶ In a chordal graph  $G$ ,  $tw(G) = \omega(G) - 1$ .
- ▶ In a connected chordal graph  $G$ ,  $lpt(G) \leq \omega(G)$ . (Rautenbach and Sereni 2014)
- ▶ In a connected chordal graph  $G$ ,  $lpt(G) \leq 4\lceil \omega(G)/5 \rceil$ . (Harvey and Payne 2023)
- ▶ If  $G$  is a connected  $n$ -vertex chordal graph, then  $lpt(G) = O(\log^2(n))$ . (Long, Milans, W. 2023+)

## Prior Work

- ▶ In a chordal graph  $G$ ,  $tw(G) = \omega(G) - 1$ .

## A Key Tool: The Helly Property

- ▶ A family of sets  $\mathcal{F}$  has the Helly property, such that if every set in  $\mathcal{F}$  pairwise intersect, there is an element belonging to every set of  $\mathcal{F}$ .

# A Key Tool: The Helly Property

- ▶ A family of sets  $\mathcal{F}$  has the Helly property, such that if every set in  $\mathcal{F}$  pairwise intersect, there is an element belonging to every set of  $\mathcal{F}$ .

## Theorem (Folklore?)

*If  $T$  is a tree,  $lpt(T) = 1$ .*

# A Key Tool: The Helly Property

- ▶ A family of sets  $\mathcal{F}$  has the Helly property, such that if every set in  $\mathcal{F}$  pairwise intersect, there is an element belonging to every set of  $\mathcal{F}$ .

## Theorem (Folklore?)

*If  $T$  is a tree,  $lpt(T) = 1$ .*

## Proof.

It is well known that the subtrees of a tree have the Helly property.

# A Key Tool: The Helly Property

- ▶ A family of sets  $\mathcal{F}$  has the Helly property, such that if every set in  $\mathcal{F}$  pairwise intersect, there is an element belonging to every set of  $\mathcal{F}$ .

## Theorem (Folklore?)

*If  $T$  is a tree,  $lpt(T) = 1$ .*

## Proof.

It is well known that the subtrees of a tree have the Helly property. Longest paths of a tree are also subtrees.

# A Key Tool: The Helly Property

- ▶ A family of sets  $\mathcal{F}$  has the Helly property, such that if every set in  $\mathcal{F}$  pairwise intersect, there is an element belonging to every set of  $\mathcal{F}$ .

## Theorem (Folklore?)

*If  $T$  is a tree,  $lpt(T) = 1$ .*

## Proof.

It is well known that the subtrees of a tree have the Helly property.  
Longest paths of a tree are also subtrees.  
Longest paths pairwise intersect in connected graphs.

# A Key Tool: The Helly Property

- ▶ A family of sets  $\mathcal{F}$  has the Helly property, such that if every set in  $\mathcal{F}$  pairwise intersect, there is an element belonging to every set of  $\mathcal{F}$ .

## Theorem (Folklore?)

*If  $T$  is a tree,  $lpt(T) = 1$ .*

## Proof.

It is well known that the subtrees of a tree have the Helly property.

Longest paths of a tree are also subtrees.

Longest paths pairwise intersect in connected graphs.

By the Helly property,  $lpt(T) = 1$ .

# A Key Tool: The Helly Property

- ▶ A family of sets  $\mathcal{F}$  has the Helly property, such that if every set in  $\mathcal{F}$  pairwise intersect, there is an element belonging to every set of  $\mathcal{F}$ .

## Theorem (Folklore?)

*If  $T$  is a tree,  $lpt(T) = 1$ .*

## Proof.

It is well known that the subtrees of a tree have the Helly property.

Longest paths of a tree are also subtrees.

Longest paths pairwise intersect in connected graphs.

By the Helly property,  $lpt(T) = 1$ . □

- ▶ Subtrees having the Helly property often translates to nice properties for chordal graphs.

# A Key Tool: Tree Representations of Chordal Graphs

- ▶ A graph is chordal if and only if it is the intersection graph of subsets of a tree  $T$  (Gavril 1974)

# A Key Tool: Tree Representations of Chordal Graphs

- ▶ A graph is chordal if and only if it is the intersection graph of subsets of a tree  $T$  (Gavril 1974)
- ▶ We call such a tree  $T$  a host tree.

# A Key Tool: Tree Representations of Chordal Graphs

- ▶ A graph is chordal if and only if it is the intersection graph of subsets of a tree  $T$  (Gavril 1974)
- ▶ We call such a tree  $T$  a host tree.
- ▶ A host tree  $T$  along with a collection of subtrees  $\mathcal{F}$ , is a tree representation of  $G$  if its intersection graph is isomorphic to  $G$ .

# A Key Tool: Tree Representations of Chordal Graphs

- ▶ A graph is chordal if and only if it is the intersection graph of subsets of a tree  $T$  (Gavril 1974)
- ▶ We call such a tree  $T$  a host tree.
- ▶ A host tree  $T$  along with a collection of subtrees  $\mathcal{F}$ , is a tree representation of  $G$  if its intersection graph is isomorphic to  $G$ .
- ▶ The vertices of the tree  $T$  correspond to cliques in  $G$ .

# A Key Tool: Tree Representations of Chordal Graphs

- ▶ A graph is chordal if and only if it is the intersection graph of subsets of a tree  $T$  (Gavril 1974)
- ▶ We call such a tree  $T$  a host tree.
- ▶ A host tree  $T$  along with a collection of subtrees  $\mathcal{F}$ , is a tree representation of  $G$  if its intersection graph is isomorphic to  $G$ .
- ▶ The vertices of the tree  $T$  correspond to cliques in  $G$ .
- ▶ If  $G$  has a tree representation where  $T$  is a path,  $G$  is an interval graph.

# A Key Tool: Tree Representations of Chordal Graphs

- ▶ A graph is chordal if and only if it is the intersection graph of subsets of a tree  $T$  (Gavril 1974)
- ▶ We call such a tree  $T$  a host tree.
- ▶ A host tree  $T$  along with a collection of subtrees  $\mathcal{F}$ , is a tree representation of  $G$  if its intersection graph is isomorphic to  $G$ .
- ▶ The vertices of the tree  $T$  correspond to cliques in  $G$ .
- ▶ If  $G$  has a tree representation where  $T$  is a path,  $G$  is an interval graph.

## Lemma (Jordan 1869)

*Let  $T$  be a tree, then there exists a vertex  $z \in V(T)$  such that each component of  $T - z$  has at most  $|V(T)|/2$  vertices.*

# The Main Result

# The Main Result

Theorem (Long, Milans, W. 2023+)

*Let  $G$  be a connected chordal graph, then  $\text{lpt}(G) = O(\log^2 n)$ .*

# The Main Result

Theorem (Long, Milans, W. 2023+)

*Let  $G$  be a connected chordal graph, then  $\text{lpt}(G) = O(\log^2 n)$ .*

- ▶ An informal proof overview.

# The Main Result

## Theorem (Long, Milans, W. 2023+)

*Let  $G$  be a connected chordal graph, then  $lpt(G) = O(\log^2 n)$ .*

- ▶ An informal proof overview.
- ▶ Let  $T$  be the (minimal) host tree of  $G$ .

# The Main Result

## Theorem (Long, Milans, W. 2023+)

*Let  $G$  be a connected chordal graph, then  $lpt(G) = O(\log^2 n)$ .*

- ▶ An informal proof overview.
- ▶ Let  $T$  be the (minimal) host tree of  $G$ .
- ▶ Find a small set of at most four vertices  $A$  that “guard” a large portion of the tree.

# The Main Result

## Theorem (Long, Milans, W. 2023+)

*Let  $G$  be a connected chordal graph, then  $lpt(G) = O(\log^2 n)$ .*

- ▶ An informal proof overview.
- ▶ Let  $T$  be the (minimal) host tree of  $G$ .
- ▶ Find a small set of at most four vertices  $A$  that “guard” a large portion of the tree.
- ▶ There are two cases for longest paths that  $A$  miss, depending on how their endpoints behave.

# The Main Result

## Theorem (Long, Milans, W. 2023+)

*Let  $G$  be a connected chordal graph, then  $\text{lpt}(G) = O(\log^2 n)$ .*

- ▶ An informal proof overview.
- ▶ Let  $T$  be the (minimal) host tree of  $G$ .
- ▶ Find a small set of at most four vertices  $A$  that “guard” a large portion of the tree.
- ▶ There are two cases for longest paths that  $A$  miss, depending on how their endpoints behave.
- ▶ We recurse on subtrees of size at most  $|V(T)|/2$ .

# The Main Result

## Theorem (Long, Milans, W. 2023+)

Let  $G$  be a connected chordal graph, then  $\text{lpt}(G) = O(\log^2 n)$ .

- ▶ An informal proof overview.
- ▶ Let  $T$  be the (minimal) host tree of  $G$ .
- ▶ Find a small set of at most four vertices  $A$  that “guard” a large portion of the tree.
- ▶ There are two cases for longest paths that  $A$  miss, depending on how their endpoints behave.
- ▶ We recurse on subtrees of size at most  $|V(T)|/2$ .
- ▶ As chordal graphs have at most  $n$  maximal cliques, i.e.  $|V(T)| \leq n$ , this obtains a transversal of size  $O(\log^2 n)$ .

# The Other Main Result

# The Other Main Result

- ▶ Let  $lct(G)$  denote the size of a minimum longest cycle transversal for a graph  $G$ .

# The Other Main Result

- ▶ Let  $lct(G)$  denote the size of a minimum longest cycle transversal for a graph  $G$ .

Theorem (Long, Milans, W. 2023+)

*Let  $G$  be a 2-connected chordal graph, then  $lct(G) = O(\log n)$ .*

# The Other Main Result

- ▶ Let  $lct(G)$  denote the size of a minimum longest cycle transversal for a graph  $G$ .

Theorem (Long, Milans, W. 2023+)

*Let  $G$  be a 2-connected chordal graph, then  $lct(G) = O(\log n)$ .*

- ▶ This result falls out of the previous theorem.

# The Other Main Result

- ▶ Let  $lct(G)$  denote the size of a minimum longest cycle transversal for a graph  $G$ .

## Theorem (Long, Milans, W. 2023+)

*Let  $G$  be a 2-connected chordal graph, then  $lct(G) = O(\log n)$ .*

- ▶ This result falls out of the previous theorem.
- ▶ Cycles have more structure than paths, so we can avoid the two-tailed recursion.

# The Other Main Result

- ▶ Let  $lct(G)$  denote the size of a minimum longest cycle transversal for a graph  $G$ .

## Theorem (Long, Milans, W. 2023+)

*Let  $G$  be a 2-connected chordal graph, then  $lct(G) = O(\log n)$ .*

- ▶ This result falls out of the previous theorem.
- ▶ Cycles have more structure than paths, so we can avoid the two tailed recursion.
- ▶ This saves a log factor from the size guarantee of the transversal.

# The Other Other Main Result

# The Other Other Main Result

- ▶ Intuitively, our tools and techniques lose their effectiveness when the host tree has many leaves.

# The Other Other Main Result

- ▶ Intuitively, our tools and techniques lose their effectiveness when the host tree has many leaves.
- ▶ If the host tree is a path, it is an interval graph, which has an longest path transversal of size one.

# The Other Other Main Result

- ▶ Intuitively, our tools and techniques lose their effectiveness when the host tree has many leaves.
- ▶ If the host tree is a path, it is an interval graph, which has an longest path transversal of size one.
- ▶ The notion of leafage was introduced by Lin, Mckee and West to measure how close a chordal graph is to being an interval graph.

# The Other Other Main Result

- ▶ Intuitively, our tools and techniques lose their effectiveness when the host tree has many leaves.
- ▶ If the host tree is a path, it is an interval graph, which has an longest path transversal of size one.
- ▶ The notion of leafage was introduced by Lin, Mckee and West to measure how close a chordal graph is to being an interval graph.
- ▶ Let  $G$  be a chordal graph, then  $\ell(G)$  denotes the minimum number of leaves in a tree representation of  $G$ .

# The Other Other Main Result

- ▶ Intuitively, our tools and techniques lose their effectiveness when the host tree has many leaves.
- ▶ If the host tree is a path, it is an interval graph, which has an longest path transversal of size one.
- ▶ The notion of leafage was introduced by Lin, Mckee and West to measure how close a chordal graph is to being an interval graph.
- ▶ Let  $G$  be a chordal graph, then  $\ell(G)$  denotes the minimum number of leaves in a tree representation of  $G$ .

Theorem (Long, Milans, W. 2023+)

*Let  $G$  be a connected chordal graph, then  $\text{lpt}(G) \leq \ell(G)$ .*

*Let  $G$  be a connected chordal graph, does  $\text{lpt}(G) \leq 1$ ?*

## Question (🏆 1)

*Let  $G$  a connected graph, does  $\text{lpt}(G) \leq C$  for some constant  $C$ ?*

## Question (Zamfirescu)

*What is the largest  $k$  such that any  $k$  longest paths of a connected graph have a vertex in common?*

# Some Other Open Questions

## Question (Zamfirescu)

*What is the largest  $k$  such that any  $k$  longest paths of a connected graph have a vertex in common?*

- ▶  $2 \leq k \leq 6$  (Skupień 1994)

# Some Other Open Questions

## Question (Zamfirescu)

*What is the largest  $k$  such that any  $k$  longest paths of a connected graph have a vertex in common?*

- ▶  $2 \leq k \leq 6$  (Skupień 1994)

## Conjecture (Hippchen)

*If  $G$  is a  $k$ -connected graph, then two longest paths in  $G$  share at least  $k$  vertices.*
