

Chapter 2.4 - One-sided limits

Motivation for one-sided limit

Recall: $\lim_{x \rightarrow 0} sgn(x)$ is not defined.

If we look at $\lim_{x \rightarrow 0} sgn(x)$ *only* for $x > 0$ then the limit *could* be 1.

If we look at $\lim_{x \rightarrow 0} sgn(x)$ *only* for $x < 0$ then the limit *could* be -1 .

One-sided limit definition

If $f(x)$ approaches L as x approaches a from *the right* (i.e. $x > a$) we write

$$\lim_{x \rightarrow a^+} f(x) = L$$

If $f(x)$ approaches L as x approaches a from *the left* (i.e. $x < a$) we write

$$\lim_{x \rightarrow a^-} f(x) = L$$

$$\lim_{x \rightarrow a} f(x) = L \text{ if and only if } \lim_{x \rightarrow a^+} f(x) = L \text{ and } \lim_{x \rightarrow a^-} f(x) = L$$

Simple example for limits

Example: Compute limits and values for the $f(x)$ defined on $[0, 3]$.

▶ $\lim_{x \rightarrow 1^-} f(x) =$

▶ $\lim_{x \rightarrow 1^+} f(x) =$

▶ $f(1) =$

▶ $\lim_{x \rightarrow 2} f(x) =$

▶ $f(3) =$

▶ $\lim_{x \rightarrow 3^-} f(x) =$

▶ $\lim_{x \rightarrow 3^+} f(x) =$

$\sin(x)$ behaves like the line $y = x$ around 0.

$$\lim_{x \rightarrow 0^+} \frac{\sin x}{x} = 1$$

Assume $\pi/2 > \theta > 0$. Then

$$\text{area } \triangle OZY < \text{area sector } OZY < \text{area } \triangle OZX$$

$$\begin{aligned} \text{area } \triangle OZY &= \\ \text{area sector } OZY &= \\ \text{area } \triangle OZX &= \end{aligned}$$

Examples using $\lim_{x \rightarrow 0} \frac{\sin x}{x} = 1$

$$\blacktriangleright \lim_{h \rightarrow 0} \frac{h}{\sin(3h)} =$$

$$\blacktriangleright \lim_{x \rightarrow 0} \frac{\tan(2x)}{x} =$$

$$\blacktriangleright \lim_{\theta \rightarrow 0} \frac{\cos(\theta) - 1}{\theta} =$$

$$\blacktriangleright \lim_{\theta \rightarrow 0} \frac{\cos(\theta) - 1}{\sin(2\theta)} =$$

Chapter 2.4 Recap

- ▶ One-sided limit is approaching x only from one side
- ▶ One-sided limits are same IFF limit exists
- ▶ $\lim_{x \rightarrow 0} \frac{\sin x}{x} = 1$
