Math-484 Homework #2

I will finish the homework before 11 am Sep 9 and bring it to class. If I have troubles with my work I may come to office hours or ask by email. If I spot a mathematical mistake I will let the lecturer know as soon as possible.
I will write clearly and neatly as the grader is not an expert in cryptography. I will sign each paper of my work and indicate if I am D14 (4 hours student).

Exercise 1: *(What is positive/negative (semi)definite?)*

Decide if the following matrices are positive or negative (semi)definite or indefinite and explain why:

(a) $\begin{pmatrix} 1 & 0 & 0 \\ 0 & 3 & 0 \\ 0 & 0 & 5 \end{pmatrix}$ (b) $\begin{pmatrix} 3 & 1 & 2 \\ 1 & 5 & 3 \\ 2 & 3 & 7 \end{pmatrix}$

(c) $\begin{pmatrix} -4 & 0 & 1 \\ 0 & -3 & 2 \\ 1 & 2 & -5 \end{pmatrix}$ (d) $\begin{pmatrix} 2 & 2 & 0 \\ 2 & 2 & 0 \\ 0 & 0 & 1 \end{pmatrix}$

Exercise 2: *(I will recall what is a quadratic form.)*

Write the quadratic form $Q_A(\mathbf{x})$ assoicated to matrix

$$A = \begin{pmatrix} -4 & 0 & 1 \\ 0 & -3 & 2 \\ 1 & 2 & -5 \end{pmatrix}.$$

Exercise 3: *(I will recall what is coercive.)*

Decide wich of these functions $\mathbb{R}^3 \to \mathbb{R}$ are coercive (of course, argue why):

(a) $f(x, y, z) = x^3 + y^3 + z^3 - xy$ (b) $f(x, y, z) = x^4 + y^4 + z^2 - 3xy - z$

(c) $f(x, y, z) = x^4 + y^4 + z^2 - xyz^2$ (d) $f(x, y, z) = x^4 + y^4 - 2xy^2$

Exercise 4: *(Do I understand the assumption of Theorem 8?)*

Show that the principal minors of the matrix

$$A = \begin{pmatrix} 1 & -8 \\ 1 & 1 \end{pmatrix}$$

are positive, but there are $\mathbf{x} \neq \mathbf{0}$ in $\mathbb{R}^2$ such that $\mathbf{x} \cdot A\mathbf{x} < 0$. Why does this not contradict Theorem 8 (1.3.3 in the textbook)?

Exercise 5: *(Can I use all that stuff to find minimizers and maximizers?)*

Find (local, global) minimizers and maximizers of the following functions:

(a) $f(x_1, x_2) = e^{-(x_1^2 + x_2^2)}$ (b) $f(x_1, x_2, x_3) = (2x_1 - x_2)^2 + (x_2 - x_3)^2 + (x_3 - 1)^2$

Exercise 6: *(A bit more coercive thinking.* ***D14 only****)*

Find a function $f(x, y)$ on $\mathbb{R}^2$ such that for each real number t, we have

$$\lim_{x \to \infty} f(x, tx) = \lim_{y \to \infty} f(ty, y) = +\infty$$

but such that $f(x, y)$ is not coercive.
