

## Network flows - First Algorithm

### Ford-Fulkerson Algorithm

*Input:* Network  $(G, u, s, t)$ .

*Output:* and  $s$ - $t$ -flow  $f$  of maximum value

1.  $f(e) = 0$  for all  $e \in E(G)$
2. while  $f$ -augmenting path  $P$  exists:
3.       compute  $\gamma := \min_{e \in E(P)} u_f(e)$
4.       augment  $f$  along  $P$  by  $\gamma$  (as much as possible)

**1:** How many iterations (at most) the algorithm needs at the following network:

( $N$  is a big integer. Try to trick the algorithm to do many steps by picking unlucky  $P$ .)

**2:** Show that  $s$ - $t$ -flow  $f$  is maximum if and only if there is no  $f$ -augmenting path. (That is, Ford-Fulkerson algorithm is correct.)

The question gives proof to

**Theorem** (Ford Fulkerson) Maximum value of an  $s$ - $t$ -flow equals minimum capacity of an  $s$ - $t$ -cut.

**3:** If  $c : E \rightarrow \mathbb{Z}$ , is it true that the flow produced from Ford-Fulekrsen is integral and that the algorithm finishes in a finite time?

This proves

**Theorem** Dantzig Fulkerson: If the capacities are integral, then there exists an integral maximum flow.

4: If capacities are integral, is it true that every maximum flow is integral?

**Theorem** Gallai; Ford and Fulerson

Every flow  $f$  can be decomposed into  $s$ - $t$ -paths  $\mathcal{P}$  and circuits  $\mathcal{C}$  with weight function  $w : \mathcal{P} \cup \mathcal{C} \rightarrow \mathbb{R}^+$  such that

- $f(e) = \sum_{P \in \mathcal{P}} w(P) + \sum_{C \in \mathcal{C}} w(C)$
- $value(f) = \sum_{P \in \mathcal{P}} w(P)$ .
- $|\mathcal{P} + \mathcal{C}| \leq |E(G)|$ .

5: Prove the theorem. Hint, use induction on number of edges  $e$ , where  $f(e) > 0$ .

### Network flows - Menger's theorem

**Theorem** Menger: Let  $G$  be a graph (directed or undirected), let  $s, t \in V(G)$ , and  $k \in \mathbb{N}$ . Then there are  $k$  edge-disjoint  $s$ - $t$ -paths iff after deleting any  $k - 1$  edges  $t$  is still reachable from  $s$ .

6: Use flows to prove the theorem in directed case.

7: Use the directed case to prove undirected case. Replacing an edge by a pair of opposite directed edges does not work. (Why?) Replace edge  $uv$  by a suitable orientation of the following gadget

Paths  $P_1$  and  $P_2$  are called *internally disjoint* if they do not share more than the endvertices.

**Theorem** Menger: Let  $G$  be a graph (directed or undirected), let  $s$  and  $t$  be two non-adjacent vertices, and  $k \in \mathbb{N}$ . Then there are  $k$  pairwise internally disjoint  $s$ - $t$ -paths iff after deleting any  $k - 1$  vertices (distinct from  $s$  and  $t$ )  $t$  is still reachable from  $s$ .

8: Prove the directed case. Use the edge case.
